ABSTRACT

Experimental aerodynamic investigations were conducted, during the period July 18-19, 1974, in the AEDC/VKF Tunnel A facility on a 0.01-scale model (52-OTS) of the integrated Space Shuttle Vehicle, including only one SRB. The purpose of the investigation was to obtain data for close-in proximity (SRB to Orbiter / Tank) effects with the Orbiter/Tank combination at relatively high α and β attitudes, and with the SRB separation motors off.

The AEDC Captive Trajectory System (CTS), which supported the SRB, was used in conjunction with the tunnel primary sector (supporting the Orbiter/Tank) to obtain "grid" type separation effects data. The one symmetrical SRB model was used interchangeably to obtain both right-hand and left-hand SRB data.

Free-stream data were also obtained for the Orbiter/Tank and for the SRB. This data was used to provide baselines for proximity effects.

The entire investigation was conducted at a free-stream Mach number of 4.5 with unit Reynolds number ranging from 4.0 to 6.5 million per foot.

INTRODUCTION

The integrated Space Shuttle Vehicle consists of four components: Orbiter, External Oxygen-Hydrogen Tank and two Solid Rocket Booster Motors. During the launch sequence, at an altitude of 140,000 ft. and Mach number 4.5, the SRB's are separated from the Orbiter/Tank combination. The objective of this test (IA87) was to determine the interacting aerodynamic forces on the various components during this phase of the launch sequence. The data obtained is to be used for determination of separation motors sizing and placement to ensure safe separation trajectories.

Isolated data were obtained for both Orbiter/Tank combination and the SRB. The Orbiter/Tank data were obtained at the following discrete attitudes: $\alpha = -5^\circ, 0^\circ, 10^\circ$ at $\beta = 0^\circ$ and 10° ; $\alpha = 0^\circ$ at $\beta = 5^\circ$; $\alpha = 0^\circ$ and 10° at $\beta = 15^\circ$.

Isolated SRB data were obtained for α values of -5, 0, 5, 10, 15, and 20 degrees at $\beta = 0$ degrees.

At each of the attitudes noted above for Orbiter/Tank, right-hand SRB separation data were obtained for the following matrix of SRB attitudes and displacements with respect to the Orbiter/Tank:

<u>$\Delta\alpha(^{\circ})$</u>	<u>$\Delta\beta(^{\circ})$</u>	<u>X(in f.s.)</u>	<u>Y(in f.s.)</u>	<u>Z(in f.s.)</u>
-5, 0, 5	-8, -4, 0	0,300	10,100,200,400	-100,0,100,200,400

At each of the attitudes noted above for the Orbiter/Tank - with the exception of the three $\beta = 0$ degrees attitudes - left-hand SRB separation data were obtained for the following matrix of SRB attitudes and displacements with respect to the Orbiter/Tank:

<u>$\Delta\alpha(^{\circ})$</u>	<u>$\Delta\beta(^{\circ})$</u>	<u>X(in f.s.)</u>	<u>Y(in f.s.)</u>	<u>Z(in f.s.)</u>
-5, 0, 5	0, 4, 8	0,300	-400, -200, -100, 0	-100, 0, 100, 200, 400

$\Delta\alpha$ and $\Delta\beta$ are in degrees and X, Y, Z are in inches full scale. Refer to Nomenclature section and Figure 2 for definitions and schematic descriptions of the parameters.

CONFIGURATIONS INVESTIGATED

The 0.01-scale 52-OTS model consisted of an Orbiter, Tank and one SRB. Full scale tank protrusions and Tank-to-Orbiter attach hardware were simulated. Refer to Figure 3. Neither the tank nose lightning rod nor SRB-to-Tank attach hardware were simulated. The SRB model was symmetrical, without separation motors shrouds, and was used interchangeably for either the left-hand or right-hand booster.

The Orbiter/Tank combination was mounted on the AEDC 0.85-inch diameter 4.00-Y-36-049 six-component internal strain gage force-moment balance. The balance was located in the Orbiter model. This, in turn, was sting mounted, inverted, on the tunnel primary sector.

The SRB was mounted on the AEDC 0.65-inch diameter 4.06-Y-36-020 balance. This, in turn, was mounted inverted on the CTS.

The entire test was conducted with all Orbiter control surfaces set at their null positions.

The components of each model are described below. Note that the Orbiter-to-Tank attach hardware is considered a part of the Tank model.

TEST FACILITY DESCRIPTION

The AEDC von Karman Facility (VKF) Tunnel A is a 40-X-40 inch, continuous, closed circuit, variable density wind tunnel with a Mach number capability of 1.5 to 6.0. Stagnation pressure ranges from a minimum of 1.5 psia at Mach 1.5 up to 200 psia maximum at Mach 6. The stagnation temperature ranges from 70 to 290°F. The tunnel throat has flexible top and bottom walls which are moved automatically by electrically driven screw jacks. Refer to Figure 2c. A detailed description of the facility may be found in the Test Facilities Handbook*.

DATA REDUCTION

Six component force and moment data were obtained for the Orbiter/Tank combination (R data) and for the one symmetrical booster model (A data). In addition, for the Orbiter/Tank combination, two base and one sting/balance cavity pressure were recorded. These pressures were located at the base of the Orbiter. The booster had only one cavity pressure.

All force and moment data were reduced to coefficient form in the body-axis system using standard AEDC data reduction procedures. No base or cavity pressure force adjustments were made to the force and moment data.

The following array depicts the reference dimensions to which the aerodynamic coefficients are applicable.

All calculated angles and displacements included corrections for sting/balance deflections in the normal and side force planes. In addition the Y (lateral) displacement was adjusted for the lateral deflection of the Tank due to roll about the Orbiter/Tank balance. The actual roll angle was very small; however, the lateral displacement affected by the roll was significant.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The *Agrobacterium* strains were cultured in YEA medium for 24 h at 28°C. The cell concentration of the strains was adjusted to 10⁸ cells/ml. The cell suspension was mixed with the plant tissue and the transformation efficiency was determined. The results were expressed as the mean ± SD of three independent experiments. The asterisks indicate significant differences between the strains at the same concentration of the cell suspension.

Figure 1. The effect of the concentration of the initiator on the polymerization of α -methylstyrene in the presence of SnCl_4 at 0°C . The concentration of α -methylstyrene was 1.0×10^{-2} mole/l. and the concentration of SnCl_4 was 1.0×10^{-2} mole/l. The polymerization was carried out in CH_2Cl_2 for 24 hr. The polymerization was terminated by the addition of methanol.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains.

The map shows the northern Adriatic Sea with the coastlines of Italy and Slovenia. Sampling stations are marked with numbers 1 through 10. Station 1 is near the Italian coast, while stations 2-10 are further out in the sea. The map includes latitude and longitude coordinates and a scale bar.
